

ABSTRACT
TOOL FOR CONVERTING .MAP FILE FORMATS

5 A system, computer program product and method for converting a file in one
format to another format. The first file written in a first format, e.g., .MAP file
format generated by the IBM Visual Age C++ Linker, may comprise a list of segment
portion/offset value pair(s) and a separate list of symbol name/address pair(s). Upon
10 associating symbol name(s) with particular segment portion/offset value pair(s), the
.MAP file written in a first format may be converted into a .MAP file written in a
second format, e.g., .MAP file format generated by the Microsoft Visual C++ Linker,
by writing a list of segment portion/offset pair(s) with their associated symbol
name(s).
